

CONSTRUCTOR AND DESTRUCTOR

AIM:

To create a program that demonstrate the types of constructor and destructor.

ALGORITHM:

- Include the required header files.
- Use the standard namespace.
- Define a class named Car.
- Declare data members for model, brand, make year, and price.
- Define the default constructor and initialize data members.
- Define the parameterized constructor and assign input values.
- Define the copy constructor to copy object data.
- Define the destructor to release the object.
- Define a function to display car details.
- Begin execution of the main() function.
- Create an object using the default constructor.
- Display the details of the first object.
- Create an object using the parameterized constructor.
- Display the details of the second object.
- Create an object using the copy constructor.
- Display the details of the copied object.

PROGRAM:

```
/*
* Program to create a Class and show the use of types of Constructor in C++
* Author : MUTHUGANESH S
* Date   : 21/1/2026
* Filename: CarModel.cpp
* retval  : void
*/
#include <iostream>
using namespace std;
```

```

class Car{
    string Model;
    string Brand;
    int MakeYear;
    int Price;
public:
    // Default Constructor

    Car(){
        cout << "\nDefault Constructor called" << endl;
        Model = "Unknown";
        Brand = "Unknown";
        MakeYear = 0;
        Price = 0;
    }
    // Parameterized Constructor
    Car(string Model, string Brand, int MakeYear, int Price){
        cout << "\nParameterized Constructor called for Model: " << Model
<< endl;
        this->Model = Model;
        this->Brand = Brand;
        this->MakeYear = MakeYear;
        this->Price = Price;
    }

    //copy Constructor
    Car(const Car &c){
        cout << "\nCopy Constructor called for Model: " << c.Model << endl;
        Model = c.Model;
        Brand = c.Brand;
        MakeYear = c.MakeYear;
        Price = c.Price;
    }

    //destructor
    ~Car(){
        cout << "\nDestructor called for Model: " << Model << endl;
    }
    void Display(){
        cout << "\nModel : " << Model << endl;
        cout << "Brand : " << Brand << endl;
        cout << "MakeYear : " << MakeYear << endl;
        cout << "Price : " << Price << endl;
    }
};

// Main function
int main(){

    //local scope to demonstrate Default Constructor
    {
        // Creating object using Default Constructor
        Car Car1;
}

```

```

        Car1.Display();
    }

    // Creating object using Parameterized Constructor
    Car Car2("Model S", "Tesla", 2020, 79999);
    Car2.Display();

    // Creating object using Copy Constructor
    Car Car3 = Car2;
    Car3.Display();

    return 0;
}

```

OUTPUT:

The screenshot shows a Windows Command Prompt window with the following text output:

```

C:\Windows\System32\cmd.e × + ▾
